

# AFO 139 – Automated export

## 139.1 Introduction

Vubis Smart now has the functionality to automatically download records to disk. Other libraries (using Vubis Smart or other library systems) can grab these records via ftp and import them in their system.

In order to achieve this functionality, two new functions have been added:

- A so-called "event trigger" that puts information in a file about all records that have been modified.
- A daemon (a program running all the time) that reads the file created by the trigger and that downloads the records in the appropriate format to a disk file.

## 139.2 Event trigger

The event trigger functionality tracks changes to bibliographic records, authority data and holdings data. Under certain conditions (see paragraph on "Parameter Management"), the following events trigger the creation of an entry in a file:

- when a new record is created;
- when two records are merged;
- when a record is deleted;
- when a record is modified;
- when the first item of an institution/location combination is added to a bibliographic record;
- when the last item of an institution/location combination is deleted from a bibliographic record.

The file created by the trigger functionality is read by the export daemon.

In some cases no output is created, in other cases the record will be exported once or more than once. It is possible to create a different entry for an institution or a group of institutions or for a range of institution/location combinations.

So each action (create, delete, etc.) can trigger 0 or more export actions.

#### **Note**

The format of the exported record depends entirely on the output profile chosen in the Parameter Management.

The export of deleted records is only possible if the records are archived.

## **139.3 Automated export**

### **139.3.1 Daemon process**

The daemon process that enables automated export of records, is started and managed from AFO 139. (See paragraph on Parameter Management.)

There is also the possibility to schedule the daemon process, for example to start it in the morning and to bring it down in the evening.

The daemon process constantly scans a file containing entries created by the event triggers (as described in the paragraph above).

For each entry in this file, the daemon reads the parameters collected via AFO 139.

Records can be exported on an individual basis (each record in a separate file) or they can be grouped (multiple records in a single file).

Export files reside on the server and not on a client workstation.

The records treated or waiting for treatment can be traced via AFO 139.

The daemon has an error recovery function. Fatal errors go into a file that can be seen via AFO 139.

**139.3.2 Directories and file names** The files containing the exported records are created in a download directory. The files names reflect the action. For example

new records could go in c:\vubis smart\export\VubisSmartExportNew, deleted records in c:\vubis smart\export\VubisSmartExportDelete.

It is possible to create different exports for authorities only, only for specific databases, for different institutions and locations. In the case of an institution or location, this institution ID and location ID is in the file path.

The file name structure is as follows:

[Prefix chosen by user]\_[Application]\_[Database]\_[sequential number]

Each file has a sequential number at the end to make it unique.

So for example a new record Bib record for institution CEN goes in the file:

c:/vubis/export/CEN/VubisNew\_Bib\_3\_123

The user can choose to put each record in a separate file. In that case a new file is created for each record. Else the record is appended to the existing file for this download type. If this file does not yet exist, it is created.

At a certain point of time (that can be immediate), all files are copied from the download directory to another directory, the ftp directory.

There are 3 optional parameters to guide this process:

- A start time. Before this time of the day there will be no transfer from the download area to the ftp area.
- The number of times the transfer is done. When this number is reached the automated export stops.
- The number of minutes to wait between a transfer and the following transfer.

## 139.4 Parameters

After starting AFO 139 a screen with a list of defined export profiles will appear. Based upon these parameters the automated export program decided to download a record or not:

No.	Database	Institution/Location	Action	Output profile
1	Bib/2	*	New records	BNA
2	Bib/2	PNB/BD	New records, Modified records, Deleted records	ExportSmartHLDGS
3	Bib/2	PNB/WP	First item of institution/location	ISO2709
4	Bib/2	PNB/WP	Modified records	ExportSmartHLDGS
5	Bib/6	PNB/WP,PNB/CEN	First item of institution/location	XportM21Hldgs

In this example the second line has the following meaning:

All new, modified and deleted records of bib database 2 will be exported based on the profile ExportSmartHLDGS. Bib records will also be exported when a first item is added by institution "PNB", location "BD" or when the last item is deleted by this institution/location.

### Columns on the screen

**Database:** This is a list of application/database combinations or application/\*

**Institution/location:** List of institution ID's/Location ID's, or \* for all

**Action:** "New records" and/or "Modified records" and/or "Deleted records" and/or "First item of institution/location" and/or "Delete last item of institution/location"

**Output profile:** a profile as defined in AFO 133.

### Options on the screen

**New line:** choose this option to create a new profile

**View/modify line:** select a profile and then this option to modify the profile

**Delete line:** select a profile and then this option to delete the profile. The system will ask for confirmation.

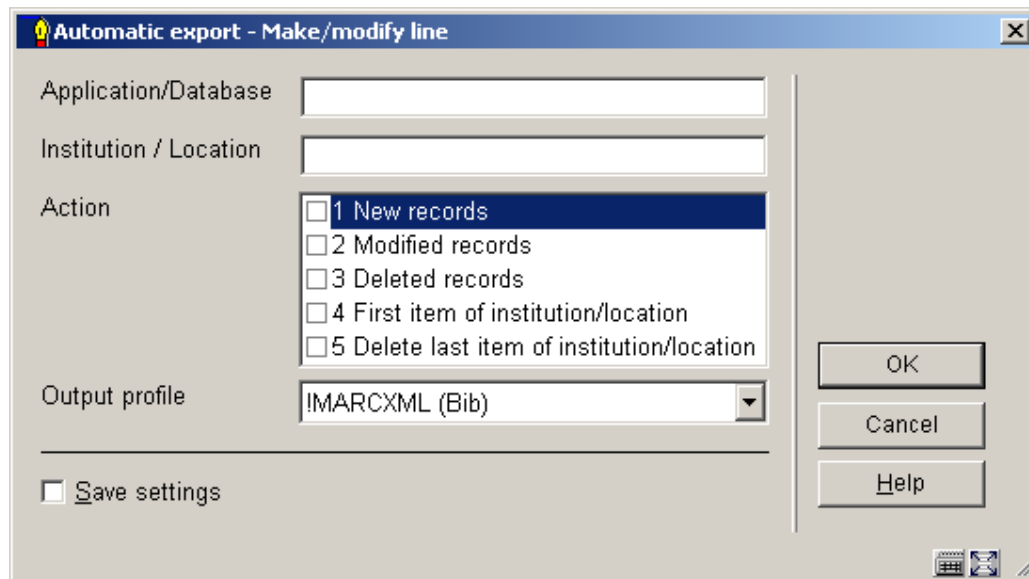

**Start export program:** choose this option to start the export

**General parameters:** This icon brings up a form deals with the behaviour of the automated export.

**View export records:** This displays a select list of all records that have been downloaded or will be downloaded. Order of display: Sorting on date in reverse order.

## 139.4.1 New profile

**New line:** choose this option to create a new profile. An input form will be displayed:

### Fields on the screen

**Application/Database:** You can fill in one or more application / database combinations. The following syntaxes are valid:

Syntax example	Explanation
----------------	-------------

Auth/*	All authority databases
Auth/2	Authority database 2
Bib/*	All bibliographic databases
Bib/4	Bibliographic database 4
Bib/2,Bib/4	Bibliographic databases 2 and 4

In case of wrong input an error message is shown.

**Institution / Location:** List of institution ID's/locations ID's (optional).

Example: BBB/\*,CCC/LOC1,INST3/LOC1/INST3/LOC2.

If something is filled in here then the action only applies if there is a item for the institution(s)/location(s) here. The ID's are verified and if they don't exist an error message is displayed.

**Action:** Choose one or more of the following:

- New records
- Modified records
- Deleted records
- First item of institution/location
- Delete last item of institution/location

The following restrictions apply:

- You cannot choose action "New institution/location" or "Delete last item of an institution/location" for an Authority output:
- You cannot export deleted records if you do not archive the records.
- You cannot export records for which the last item of an institution/location is deleted if you do not archive the records.

**Output profile:** Choose one output profile (this is mandatory). You cannot choose an authority output profile for a bibliographic export and vice versa. If you try this, the system will display an error message.

## 139.4.2 Start export

**Start export program:** choose this option to start the export. The following message is displayed:

After acknowledging this message, the system will switch to the standard procedure for managing processes (which offers you the choice between Online, Batch and Memory).

Note that the daemon does not show progress information, which is one of the reasons why it should not be started in Online mode. The daemon does not stop automatically: once it is started it keeps on running. It can be stopped via AFO 642.

## 139.4.3 General parameters

**General parameters:** This icon brings up a form deals with the behaviour of the automated export.

## fields on the screen

**Directory:** The directories will be created if they do not yet exist. The ftp and download directory cannot be identical.

**Prefix:** The prefixes are used to differentiate the content of the files by their file names. However, this is not necessary. For example, you can give new records and modified records the same prefix.

Note however that files that contain deleted records should contain the prefix “Delete”.

The parameters “**Start time**” and “**Transfer...**” (three parameters): Together these parameters regulate the transfer of files from the download directory to the ftp directory. For example, you can start the ftp export at 7 PM and do it once for the day. You can start at 8 PM and do it every hour. If minutes = 0 and start time = \* (or earlier than current time), then each file is moved instantly after creation from the transfer to the ftp directory.

## Note

This is only for the transfer from download directory to ftp directory. The export daemon stays active all the time, downloading records to the download directory. The export daemon can be stopped from AFO 642.

**Seconds wait (only for system administrator):** is to slow down the process, because it might influence response times. Do not modify this parameter unless you are asked to.

## 139.4.4 View export records

**View export records:** This displays a select list of all records that have been downloaded or will be downloaded. Order of display: Sorting on date in reverse order..

No.	Time action	Status	Application	Database	Record	Institution	Location	Action
1	03 May 2006 16:37:19	Waiting	Bib	2	3550	PNB	BD	Modified records
2	03 May 2006 16:37:19	Waiting	Bib	2	3550	PNB	WP	Modified records
3	03 May 2006 10:56:52	Waiting	Bib	2	3550	PNB	BD	Modified records
4	03 May 2006 10:56:52	Waiting	Bib	2	3550	PNB	WP	Modified records
5	03 May 2006 10:11:07	Waiting	Bib	2	3550	PNB	BD	Modified records
6	03 May 2006 10:11:07	Waiting	Bib	2	3550	PNB	WP	Modified records
7	02 May 2006 20:21:27	Waiting	Bib	2	3550	PNB	BD	Modified records
8	02 May 2006 20:21:27	Waiting	Bib	2	3550	PNB	WP	Modified records
9	02 May 2006 16:24:47	Waiting	Bib	2	3550	PNB	BD	Modified records
10	02 May 2006 16:24:47	Waiting	Bib	2	3550	PNB	WP	Modified records
11	02 May 2006 16:13:13	Waiting	Bib	2	3550	PNB	BD	Modified records
12	02 May 2006 16:13:13	Waiting	Bib	2	3550	PNB	WP	Modified records
13	02 May 2006 12:13:18	Waiting	Bib	2	3229	PNB	BD	Modified records
14	02 May 2006 12:13:18	Waiting	Bib	2	3229	PNB	WP	Modified records
15	02 May 2006 12:08:14	Waiting	Bib	2	553	PNB	BD	Modified records
16	02 May 2006 12:08:14	Waiting	Bib	2	553	PNB	WP	Modified records
17	27 Apr 2006 10:14:51	Waiting	Bib	2	553	PNB	BD	Modified records
18	27 Apr 2006 10:14:51	Waiting	Bib	2	553	PNB	WP	Modified records
19	27 Apr 2006 09:58:08	Waiting	Bib	2	553	PNB	BD	Modified records
20	27 Apr 2006 09:58:08	Waiting	Bib	2	553	PNB	WP	Modified records
21	27 Apr 2006 09:51:10	Waiting	Bib	2	391	PNB	BD	Modified records
22	27 Apr 2006 09:51:10	Waiting	Bib	2	391	PNB	WP	Modified records
23	29 Mar 2006 15:14:36	Waiting	Bib	2	1988	PNB	BD	Modified records
24	29 Mar 2006 15:14:36	Waiting	Bib	2	1988	PNB	WP	Modified records
25	29 Mar 2006 10:07:58	Waiting	Bib	2	1739	PNB	BD	Modified records
26	29 Mar 2006 10:07:58	Waiting	Bib	2	1739	PNB	WP	Modified records
27	28 Mar 2006 14:15:51	Waiting	Bib	2	1356	PNB	BD	Modified records
28	28 Mar 2006 14:15:51	Waiting	Bib	2	1356	PNB	WP	Modified records
29	28 Mar 2006 14:03:18	Waiting	Bib	2	1356	PNB	BD	Modified records
30	28 Mar 2006 14:03:18	Waiting	Bib	2	1356	PNB	WP	Modified records

The status is "Waiting", "Treated" or "Error":

- "Waiting" means that the record is in the file with records to be downloaded but it is not yet actually downloaded. Probably the export program is not running.
- "Treated" means that the record is downloaded to disk file.
- "Error" means that the record could not be downloaded due to a problem.

### Options on the screen

**View details:** This icon shows a form with the following detailed information:

- Export profile
- Date and time of treatment
- File name where record is downloaded
- Error message text

**Delete (+):** Remove one or more lines.

**Remove processed records:** Remove all records with the status "Treated".

**Remove errors:** Remove all records with the status "Error".

**Process again:** This option is to treat the record again, for example because there was an error caused by a problem that is now solved. The line is copied to a new line, with the current date and time and the status "Waiting".

**Refresh screen:** This option re-displays the screen. As the most recent entries are shown first, you can keep track of the latest new entries.

**Show only errors:** This option shows only the errors.

**Show general errors:** This shows a list with the internal system errors that are logged in a separate error file.

You have the ability to remove errors from the overview by using the Remove error option.
